

2) AI BrowserExtension - With vibe coding generate the testscripts in the language selected (tool/language of your choice)

Say--playwright/typescript

(as of only page layer is generated)

Used following prompt to get started:

Read my entire workspace and understand how extension is implemented in terms of the User Interface, prompt creation by assembling to send to the selected LLM provider.

Modify such that along with page class, also the step definitions code is also generated corresponding to each of the steps in feature file that use the page class.

Show each of the output separated by separator like

"=====<HEADING>=====", where <HEADING> will be "Feature file" or "Page Class" or "Step definitions"

There were multiple issues where the step defs section initially showed object(), shared the error with co-pilot, still error continued, on 2nd retry changes from co-pilot worked , but the output of stepdef was getting truncated. Shared the partial output and co-pilot made further changes. Now for playwright-typescrip combination it may be working ok. Did not check actual output in great detail but it seems it looked logically correct.

Though seeing an error on chrome manage extension, it indicates perhaps model is hitting limits. Needs further checking investigation.

=====Feature file=====

Feature: Login to OpenTaps

Scenario Outline: Successful login with valid credentials

Given I open the login page

When I type "username" into the Username field

And I type "password" into the Password field

And I click the Login button

Then I should be logged in successfully

Examples:

username	password
"arun.kumar"	"Arun@1234"
"sita.patel"	"Sita@5678"
"kumar.john"	"Kumar@9012"

Scenario Outline: Unsuccessful login with invalid credentials

Given I open the login page

When I type "username" into the Username field

And I type "password" into the Password field

And I click the Login button

Then I should see an error message "Invalid username or password"

Copy
